

Safe Fun in the Sun

Nutrition Offers UV Shield

Sharron Leonard

Because sunlight activates the synthesis of vitamin D, a nutrient that works with vitamin A to build strong bones and good eyesight it is essential for health. Furthermore, bright light, specifically sunshine, can improve your mood and help ward off depression. But all things in moderation. Overexposure to UV rays can cause potentially extensive damage to the skin, an all-too-common occurrence. "Skin cancer is now considered epidemic throughout the nation", according to The Centers for Disease Control Prevention. "Over one million residents in the United States are expected to get skin cancer this year more people than the collective total of all who will get cancers of the breast, prostate, lung and colon. Exposure to

toxic molecules. These are known as free radicals and can lead to malignancies. Sunscreen, adequate coverage and sunglasses have long been recommended to avoid this damage, but diverse studies now suggest some promising supplemental strategies for UV protection from the inside out. Certain nutrients and a low-fat diet have shown specific anti-cancer properties.

Free Radical Control

Antioxidants have long been known to neutralize free radicals and render them inactive, protecting cellular structure. Powerful antioxidants include vitamin C (citrus fruits, strawberries, broccoli, tomatoes), vitamin E (asparagus, raw

pigments found in predominately green leafy vegetables, also have strong antioxidant properties that diminish the effects of UV irradiation by reducing the acute inflammatory responses. Lutein- and zeaxanthin-rich foods include green, leafy vegetables such as spinach, kale, broccoli and turnips as well as corn and egg yolks.

As long ago as 1991, studies have shown green tea consumption and topical application afford protection against skin tumors. More recent research corroborates these results and points to the polyphenols in green tea, which contain antioxidant and anti-inflammatory properties. In addition, one major element in green tea, epigallocatechin-3-gallate (EGCG), is thought to stop production of an enzyme required for cancer cell growth. Several cups of green tea might be a worthwhile addition to your daily routine.

Avoiding fatty foods may also provide benefit. Studies suggest that a low-fat diet can reduce the incidence of premalignant lesions called actinic keratosis. To maintain a low-fat diet, the U.S. Department of Agriculture recommends that you get most of your calories from organic, whole foods such as grains, fruits, and vegetables and to avoid foods high in saturated fats. For more information, visit the website www.health.gov/dietaryguidelines/.

Know the Index

Even though it is helpful to counteract damage to your skin through nutrition, it remains vital to shield yourself from the sun's invisible UV rays and avoid them when they're at their most intense. The UV Index, a measurement of ultra-violet sun radiation, can assist in protecting you from potentially harmful exposure. This forecast of UV intensity ranges from a nighttime low of 0 to a very sunny 10-plus. It is greatest when the sun hits its apex (noon), then rapidly decreases as the sun moves across the afternoon sky. The higher the UV Index, the shorter the time for skin damage to occur. To determine the UV Index in your area, check your local newspaper, TV and radio news broadcasts, or you can visit www.epa.gov/sunwise/uvindex.html, the U.S. Environmental Protection Agency's website. This rating allows you

to determine your geographic risk and, in turn, the level of adequate sun protection needed.

Regardless of your sun-screening defenses, always be vigilant about checking your skin for possible signs of melanoma. "When melanoma is detected in its early stage, surgical removal cures the disease in most cases," according to the American Academy of Dermatology. "If the disease has spread to lymph nodes, the 5-year survival rate is 30-40 percent. If the disease has spread to distant organs, the 5-year survival rate is 12 percent."

Melanoma appears as a pre-existing mole that changes, or as a new mole on previously unaffected/clear skin. Performing skin self-exams every few months and knowing the characteristics to look for in any mole identified will enhance early detection and reduce risk.

For more information on early detection, visit www.skincancer.org.

And don't forget common sense practices:

--Avoid long-term sun exposure and wear a hat, sunglasses, and protective clothing.

--Apply sunscreen with SPF of 30 or above.

--Avoid artificial tanning devices.

--And be aware of sun exposure year-round.

With a few protective measures, you can continue to enjoy fun in the sun safely. Wear your sunscreen--in the winter months as well as the summer--seek shade, cover up with sleeves and pants, and don't forget your hat!

A colorful diet can help provide sun protection from the inside out.

Managing Arthritis

Exercise and Bodywork Keep Joint Pain at Bay

The word arthritis strikes fear in the hearts of older adults. It often signifies aging, pain, inactivity, and disability. However, new research shows moderate physical exercise can actually ease arthritis symptoms by decreasing pain and increasing a person's likelihood of living a normal life.

Understanding Arthritis

The most common form of arthritis--osteoarthritis, or also known as degenerative arthritis--affects more than twenty million Americans. Osteoarthritis (literally meaning "bone-joint inflammation") is caused by wear and tear on joint surfaces and most frequently involves the hips, knees, lower back, neck, and fingers. More than half of people over sixty-five have some evidence of osteoarthritis on X-rays, although it doesn't always manifest as symptoms.

Many problems arise from a sedentary lifestyle. Joints lose flexibility and muscles lose strength, feeding the cycle of pain, inactivity, and more pain.

Exercise Offers Sweet Relief

Vigorous walking, swimming, and bicycling boost the release of powerful endorphins, the body's natural painkillers. When done four to five days a week, these aerobic activities improve general cardiovascular health and aid in weight management (obesity is the single biggest risk factor for osteoarthritis).

Strengthening and stretching exercises targeted at maintaining joint flexibility and muscle strength--especially for at-risk joints--slow the progression of degenerative arthritis. Yoga classes and moderate weight lifting programs are excellent ways to improve strength and flexibility. Bodywork can also provide relief.

If arthritis is slowing you down, get serious with your exercise plan. Consult your physician; work with a professional trainer, physical therapist, yoga instructor, or bodyworker; and start a gentle, progressive exercise program. Your joints will reward you for it, and you'll free yourself from arthritic pain.

Stretching can slow degenerative arthritis.

What Your Massage Therapist Needs to Know

Angela England

Most massage therapists guide first-time clients through an intake process that includes discussing health histories and other medical concerns. But talking with your therapist about these things should not end with your first massage. Before each session, take a minute to speak with your therapist about any new medical conditions or injuries, lasting aches and pains, or any other changes in your life. Here are some of the issues your massage therapist should know about.

Medical Changes

It's a good idea to regularly update your medical record with your therapist, especially if you've been diagnosed with an illness or medical condition--such as high blood pressure, heart disease, diabetes, a chronic autoimmune disease,

or skin allergies--or are taking any new medications. Certain medical concerns preclude you from receiving massage. Other conditions, such as pregnancy, simply change the way your practitioner approaches the session.

A New or Acute Injury

Maybe you spent hours driving to a destination getaway and your shoulders ache, or you stepped off the porch wrong and sprained your ankle. Any time you have a new ache, pain, sprain, twist, or pulled muscle, mention it to your therapist. Depending on the location and extent of your injury, the session may need to be postponed or the injury site avoided until more healing has occurred.

Personal Preferences

This category is less obvious, but equally important. Everyone has unique preferences and sometimes there may be something you would like to change for your next massage. Whether you want to bring your own music, have the temperature adjusted, or be draped in an extra blanket, your therapist can easily adapt as long as you communicate your preferences.

Help your practitioner help you. Take a moment to check in with him or her before your next session.

Angela England enjoys doing massage, gardening, writing, and spending time with her three young children.
